### SecureWAN

Wide Area Networking over Private DSL

SALES: 0844 561 6102

#### Scalable Multi-site Network

When an enterprise spreads over multiple sites the ability to communicate and exchange data efficiently and securely is of paramount importance. The creation of a single coherent network becomes a difficult task as organisations have to take into account many contributing factors like speed, scalability, security and resilience.

SecureWAN is a high level Wide Area Networking solution designed to provide companies with multiple locations the ability to interconnect at high speed through a dedicated secure private network as if in the same physical office. This scalable solution allows you to grow your network on a site by site basis without the long lead times and large investment associated with conventional methods. The SecureWAN network is primarily for secure inter-site access although Internet breakout can also be provided on a site-by-site basis at the level you need through Waveworks' resilient Internet feeds.

Each solution is uniquely designed by a Waveworks' Network Consultant creating a fully managed network solution tailored specifically to your organisation's requirements.

The SecureWAN service is built on a foundation of three key elements...

#### Security

Network security is of fundamental importance in a SecureWAN solution which is why all data that's transmitted between remote locations across the private network is also encrypted so that only the intended recipient can interpret it. All security aspects including firewall policies and traffic monitoring are designed and supported by Waveworks thus ensuring data integrity.

#### Management

All SecureWAN solutions are fully managed end-to-end by Waveworks including the provision/migration/cancellation of lines and services saving your business time and money. Proactive monitoring also continually monitors your network performance and availability 24x7 ensuring you receive a superior business class service.

#### Resilience

Waveworks provides resilience as standard on all SecureWAN network solutions through their geographically diverse core network which is for business use only and incorporates real-time monitoring and backup systems designed to identify and quickly resolve any issues within the network.

#### Features

- ▶ Uses secure private network
- ▶ Data encrypted to ensure integrity
- ▶ Routers with integrated firewalls
- ▶ Fully managed solution 24x7
- ▶ Internet access if required
- ▶ Upgradeable at any time
- ▶ Technical support help desk

#### Benefits

- ▶ Your data is more secure (not routed over the Internet)
- ▶ Faster and more resilient using private network
- ▶ No internal expertise needed
- ▶ Fully managed provisioning
