

SecureWAN-lite SSL

Wide Area Networking over SSL VPN

SALES: 0844 561 6102

Remote Access

SecureWAN-lite SSL is a fully managed, software-based SSL VPN solution designed to provide remote workers with the ability to securely connect anytime, anywhere, at high-speed to the corporate network. Using only a JAVA enabled Internet browser the centrally managed solution is simple to use and requires no other client software.

This competitively priced solution provides remote worker connectivity without the overhead of investing in expensive VPN hardware. Each solution is designed by a Waveworks' Network Consultant creating a total 'plug and play' network tailored specifically to your organisation's requirements.

The SecureWAN-lite SSL solution provides businesses with three key benefits...

Security

Using industry standard 128bit SSL encryption combined with password authentication, SecureWAN-lite SSL provides full network layer access without the need for expensive VPN hardware. Finite control to network resources can be administered through user profiling, allowing administrators to group users depending on the level of network access they want to allow.

Management

All SecureWAN-lite SSL solutions are fully managed end-to-end by Waveworks including the provision/migration/cancellation of DSL lines and services saving your business time and money. The VPN platform and network are proactively monitored to ensure you receive a business class service at all times.

Scalability

SecureWAN-lite SSL is designed to support the most demanding network requirements. Delivered using a dedicated network server platform, each SSL server is capable of handling over 200 concurrent connections with the ability to scale by clustering servers according to the size of remote worker network. By utilising the Waveworks' DSL network, this scalable solution allows you to grow your remote network on a site-by-site basis without the long lead times and large investment associated with conventional methods.

JAVA is a trademark of Sun Microsystems, Incorporated

Features

- ▶ 128bit SSL encrypted data
- ▶ Password authentication
- ▶ Requires only standard web browser with JAVA support
- ▶ Routers with integrated firewalls

Benefits

- ▶ Secure, remote access to your corporate network
- ▶ Connect any time from any location on any pc
- ▶ Scalable quickly
- ▶ No expensive VPN routers
- ▶ Fully managed solution
