WaveFilter-web

Managed Web Content Filtering

SALES: 0844 561 6102

Security

Protecting your network from the threat of external compromise and malicious attack is hard enough, but what about when your own users open the door into the network without even knowing it? Securing your network from within is a crucial element in protecting your business and knowing what your users are accessing on the Internet is a key step to achieving this.

Employee abuse of Internet usage poses a significant threat to the network, not to mention the cost to the business in terms of wasted bandwidth utilisation. WaveFilter-web is a managed content filter and web proxy solution designed to provide transparent filtering of web usage on the corporate LAN. WaveFilter-web works by using a range of techniques to identify and filter-out access to websites with unsuitable or malicious content. By performing an 'in-line' analysis of the web traffic, WaveFilter-web intelligently scores the content against an array of keywords and phrases commonly associated with undesirable websites. In addition all requested URL's are checked against a comprehensive blacklist to prevent users from accessing websites that are unsuitable for corporate use. If WaveFilter-web finds a match, a customised block page is presented to the user instructing them that the website they are trying to access has been deemed unsuitable, providing an instant deterrent against future misuse.

Management

Full management of the solution is provided by Waveworks although administrators have the option to maintain their own blacklist through a secure web interface. In addition to the comprehensive filtering techniques employed by WaveFilter-web, all access requests and web browsing activity is logged on a daily basis allowing network administrators to quickly identify and deal with staff who are abusing their web privileges. WaveFilter-web stores up to 30 days of Internet usage activity detailing every web page, file, or image that has been accessed along with the work station used to make the request. Through the easy to use web interface, administrators can check daily to ensure that staff members adhere to corporate policy.

Risk

With the ever-evolving laws relating to digital content and copyright, companies that do not monitor Internet usage are at risk of significant damages caused by their own staff. WaveFilter-web offer you the ability to reduce those risks to a minimum.

Features

- ▶ Intelligent 'content scoring' engine for accurate blocking
- ▶ File download filtering - block files with specific extensions
- ▶ Customisable blacklist/whitelist
- ▶ Fully managed solution
- ▶ 30-day web usage logs via secure web interface

Benefits

- ▶ Transparent to end users - no browser proxy settings required
- ▶ Impossible for end users to bypass
- ▶ Prevention against malicious content getting into the network
- ▶ Protection from liability regarding illegal content
