

### WaveGuard Firewall

Protecting Your Network

SALES: 0844 561 6102

#### Network Security

Protecting your company's assets from the threats of the World Wide Web is critical, especially with the use of 'always on' Internet connectivity. The ever increasing sophisticated levels and frequency of malicious attacks rightly gives great concern to those tasked with ensuring the security of the corporate network. Keeping your network secure and your corporate assets safe can be a daunting and time consuming exercise and requires a skill set that is often difficult to recruit. Even with the correct skill set, finding an 'out the box' product that offers you the flexibility to meet your exact requirements is difficult, often resulting in compromise.

#### Custom Engineered Platform

WaveGuard is a professionally managed firewall solution that has been developed to offer you maximum security and flexibility. Unlike 'out the box' firewalls, WaveGuard is designed and built specifically to meet the most demanding network requirements. Based on a custom engineered platform using industrial strength hardware for added security and resilience, WaveGuard can filter and restrict traffic from multiple networks at gigabit speeds. Each WaveGuard is pre-configured by Waveworks in partnership with the customer to create a security policy that fits perfectly into the network environment. Onsite installation and testing is also provided as standard with all WaveGuard solutions.

#### Firewall Management

All ongoing maintenance and configuration changes to the WaveGuard setup are performed remotely over a secure tunnel by Waveworks' NOC centre who actively manage the Firewall 7 days a week to ensure that security is kept at the highest level at all times. Customers can contact the Help Desk for advice on their network security and to request configuration changes to the firewall rule set which will be dealt with by a trained expert.

#### Features

- ▶ Customized secure Linux platform
- ▶ Attempted intrusion detection
- ▶ Real-time network analysis
- ▶ Flexible configuration
- ▶ Multiple network protection

#### Benefits

- ▶ High level security
- ▶ Highly scalable
- ▶ Custom built to your needs
- ▶ No security/firewall expertise needed
- ▶ Fully managed service (NOC)
- ▶ Monitored 24/7/365
